Restricted Single-Channel Employee Access

Mighty Organix (Dane Dison) · Version 1.0 · October 20, 2026 · Status: research only — nothing provisioned

Changelog: v1.0 (2026-10-20): first release. Fresh start; prior partial drafts discarded.

Goal

Set up one **standalone employee identity** that works on **exactly one channel**: either **cellular / mobile** (a phone) **or web / internet** (a browser) — not both, and with no broader system access.

Primary design goal: the employee's benefit. They should start the same day, sign in once, and hit as little friction as possible on their allowed channel. Mighty's control and security are secondary and still required.

Out of scope: FRP bypass, unlock tools, torrents, phone blacklists, stolen-device recovery.

---

1. Ranked recommendation

Rank	Approach	Best when	Employee friction
1 (pick this)	**Dedicated Google Workspace user in its own Organizational Unit (OU), apps limited to what they need, plus Context-Aware Access for the chosen channel.** Pair with a **Slack single-channel guest** if they need team chat.	Mighty already runs on Google, or will.	One Google login. Same-day start.
2	**Dedicated Microsoft 365 / Entra ID user with Conditional Access** (browser-only *or* mobile-apps-only on a compliant device). Same Slack guest pattern.	Mighty already pays for Microsoft 365 Business Premium (includes Entra ID P1 + Intune).	One Microsoft login.
3	**Dedicated company phone + business number** (cellular-only path). Only allowed apps installed; identity still from option 1 or 2.	The job is calls, SMS, photos, field check-ins.	Open the phone. Almost zero setup for them.
4 (add-on, not a human seat)	**Separate Grok Bot agent** with **only one channel / connector** attached (e.g. one Slack channel or one inbox). Never Dane's personal accounts.	After-hours intake, drafting, triage.	N/A — agent, not a person.

Do not start with a shared login, Dane's personal Google/Microsoft account, a full Slack member seat, or a GitHub org invite. Those all expand access beyond one channel.

Why #1 wins for employee benefit first

- One familiar login (Gmail-style). Most people already know it.
- Admin turns apps on/off in the OU so the employee never sees tools they can't use.
- Slack single-channel guest is free (quota: 5 guests per paid member on paid Slack plans) and lands them in exactly one channel — zero channel hunting.
- Context-Aware Access can require device OS / managed device so "web-only" or "mobile-only" is real, not a handshake promise.
- Scaling later means cloning the OU template, not reinventing policy.

Edition note (accurate, not invented): Context-Aware Access requires Google Workspace **Business Plus, Enterprise, or Education** (or Cloud Identity Premium). On Business Starter / Standard you can still create the separate user + OU and turn apps off; for hard channel locking, use a company-owned managed device (#3) or upgrade the seat / edition that holds these restricted users.

---

2. Option evaluation (what each tool actually does)

Option	One-channel lock?	Employee ease	Requirements / limits
Separate Google user + OU + Context-Aware Access	**Yes.** Access levels by identity, device, OS, IP; can target desktop web vs mobile apps when endpoint management is in play.	High — one Google login	Context-Aware: Business Plus / Enterprise / Education / Cloud Identity Premium. App on/off per OU works on all editions.
Separate M365 user + Conditional Access	**Yes.** Policies can target platform and client app type (browser vs mobile apps) and require compliant / app-protected devices.	High — one Microsoft login	Entra ID P1 (in Microsoft 365 Business Premium) + Intune for device compliance.
Slack single-channel guest	Limits **Slack scope** to one channel, not the device channel. Works on web *and* mobile Slack apps.	Very high — invite link, one channel	Paid Slack plan. Up to 5 free single-channel guests per paid active member. Cannot create channels or install apps.
Dedicated phone + number	**Yes for cellular.** Physical separation.	Very high — just use the phone	Company-owned Android/iPhone enrolled in Google endpoint management or Intune. Number via carrier, Google Voice (Workspace), or Teams Phone.
Dropbox shared folder only	Scope limit, not channel limit	High	Share one folder; do not invite as team admin. Prefer "viewer" or "editor" on that folder alone.
	Scope limit	High	

Option	One-channel lock?	Employee ease	Requirements / limits
DocuSign as signer only			Send envelopes *to* their email; do not give Admin / Sender seats unless the job requires it.
GitHub	Usually **out** for v1	—	No seat by default. Later: read-only outside collaborator on one repo if needed.
Separate Grok Bot agent, one connector	**Yes** — only what you connect	N/A (agent)	Own inbox/channel; human approval for outbound sends; never attach Dane's full account set.

---

3. What the employee CAN touch

Web-only tier

- Browser access to the apps turned on in their OU (typical: Gmail, Calendar, Drive — or Outlook / OneDrive on M365).
- One shared Drive folder **or** one Dropbox folder that someone shared with them (not the company root).
- Their **one** Slack channel as a single-channel guest (post, read history, DM people in that channel, join huddles).
- DocuSign envelopes sent *to* their work email (signing only), if that is part of the job.
- Optional: a booking or form link (Cal.com / Tally) if their job is intake.

Mobile-only / cellular tier

- The managed company phone and its business number (calls / SMS).
- Allowed mobile apps only (examples: Gmail, Calendar, Slack, camera for job photos, DocuSign app for signing).
- Same shared folder and one Slack channel as above, accessed from the phone.
- Location / photo uploads into the shared folder if the workflow needs them.

Both tiers

- Only files, calendars, and channels that were **explicitly shared** with this identity.
- Ability to leave / be removed cleanly when the engagement ends (deactivate the user; revoke Slack guest; wipe managed device).

---

4. What the employee CAN'T touch

- The **other** channel (web-only identity blocked from mobile sync / unmanaged mobile apps; mobile-only identity blocked from desktop browsers where Conditional Access / Context-Aware Access enforces it).
- Admin consoles, billing, domain DNS, other users' mailboxes, and company-wide Drive / Dropbox roots.
- **GitHub** org membership (default), DocuSign admin / send-as-Mighty, and Slack channels other than the one assigned.
- Dane's personal accounts, Dane's Grok Bot agents, and any connector that was not deliberately attached to *this* identity.
- Installing Slack apps, creating channels, exporting workspace data, or changing security settings.

---

5. Decisions Dane must make (before anything is built)

1. **Which single channel for this first employee?** Mobile/cellular **or** web. (Pick one.)
2. **Identity platform:** Google Workspace or Microsoft 365 — use whichever Mighty already pays for. If Google is Starter/Standard and you need hard Context-Aware locks, decide: upgrade edition for this OU, or use a company phone as the lock.
3. **Device ownership:** company phone / laptop (cleanest) vs. bring-your-own with app protection.
4. **Data scope:** name the **one** Slack channel, the **one** shared folder, and whether they get a calendar.
5. **Role type:** contractor (guest-friendly) or employee (full seat). Affects Slack guest vs member and offboarding checklist.
6. **Offboarding SLA:** same-day deactivate + device wipe — who does it (Dane or a future admin agent)?
7. **Whether a Grok Bot agent is needed alongside the human** for after-hours on that same channel.

Nothing in this PDF has been provisioned. Each of the above needs Dane's explicit choice.

---

6. Scalability and expansion (growth without rebuilding)

Design the first seat as a **template**, not a one-off.

6.1 Adding more restricted employees later

- Clone the OU (Google) or Conditional Access group (M365): same apps, same channel policy, new user.
- One Slack channel per role (or one shared ops channel with many single-channel guests) — guest quota scales with paid members (5 guests per paid member).

- Naming convention: `role.person@yourdomain` or `field01@…` so offboarding and audits stay obvious.
- Checklist as a one-page runbook: create user → add to OU/group → share folder → invite Slack guest → hand them the one login / one phone.

6.2 New channels or access tiers over time

Define **tiers**, not snowflake accounts:

Tier	Channel	Typical tools
T1 Web intake	Web only	Gmail + one folder + Slack guest
T2 Field	Cellular only	Company phone + Slack + camera → folder
T3 Signer	Web or mobile	Email + DocuSign signer only
T4 Agent	One bot connector	Separate Grok Bot; no human login

Promote someone by moving them to a higher tier's group — do not grant ad-hoc admin or full Slack membership "just this once."

6.3 Growth paths that avoid a rebuild

- Keep **identity** (Google or M365) as the spine; treat Slack, Dropbox, DocuSign, GitHub as **scoped attachments**.
- When you outgrow free Slack guests, convert hot roles to multi-channel guests or members deliberately — still channel-scoped by policy.
- When you need GitHub: add as outside collaborator on **one** repo, read-only first.
- When you need automation: spin a **new** Grok Bot agent per function (intake bot ≠ billing bot), each with one connector — never widen Dane's personal agent.
- Document the template in this research folder; next hire is copy-paste, not a project.

6.4 What "employee-first" looks like at scale

- Day-one packet: one login, one channel link, one folder link, optional phone unlock PIN from Dane.
- No VPN scavenger hunt, no "ask IT for six apps," no password managers they must buy.
- Friction stays on **Mighty's admin side** (OU, CA policies, guest invites) so the worker stays fast.

---

7. Suggested day-one setup (after Dane decides #1–#7)

Web-only (Google path — recommended default)
1. Create user in OU `Restricted / Web-only`.
2. Turn on only Gmail, Calendar, Drive (or fewer).
3. Apply Context-Aware Access level that allows browser on approved conditions; block

unmanaged mobile as configured for your edition.
4. Share one Drive (or Dropbox) folder.
5. Invite as Slack single-channel guest to `#ops-intake` (example name).
6. Send them: login, Slack invite, folder link. Done.

Cellular-only
1. Same identity OU `Restricted / Mobile-only`.
2. Company phone enrolled; install only allowed apps.
3. Business number on that phone.
4. Slack guest + shared folder on the phone.
5. Hand them the phone. Done.

Grok Bot add-on
1. New agent identity (not Dane's).
2. Connect **one** channel only (e.g. that Slack channel or a dedicated inbox).
3. Require human approval for outbound messages.
4. Never attach GitHub, DocuSign admin, or Dane's mail.

---

8. Mighty benefit (secondary, still delivered)

- Blast radius limited to one identity and one channel.
- Clean offboarding: deactivate user, revoke guest, wipe device.
- Audit trail on Google/M365 and Slack.
- Scales by cloning tiers instead of granting "temporary" full access that never expires.

---

9. Sources checked for accuracy (Oct 20, 2026)

- Slack Help: guest roles (single-channel vs multi-channel), billing and permissions.
- Google Workspace Admin Help: Context-Aware Access overview, access levels, app assignment (desktop web vs mobile apps; edition requirements).
- Microsoft: Conditional Access / Entra ID P1 availability via Microsoft 365 Business Premium (standard product packaging; confirm on your tenant before buying).

Prices and plan SKUs change; re-check vendor admin pages before purchasing upgrades.

End of v1.0. Research only — no accounts created, no invites sent, live site homepage untouched.
